

# Tyre Bale Trials

## Western Half

As with the eastern half, this part was also wrapped in geogrid. However, part of the trial was to see how differently the bales would react if shingle was kept out of the voids

So a membrane was wrapped around the bales to allow water through but prevent the ingress of sand and shingle

Both geogrid and membrane were pulled over the top of the block

Once held in place by shingle placed on top of the bales, the geogrid was linked to itself – sealing the envelope
